PROJECT DESIGN PHASE: PROPOSED SOLUTION

Proposed Solution Template

Following is the proposed solution template. This details the bookstore's parameters, business goals, and engineering structures.

S.No.	Parameter	Description
1.	Problem Statement (Problem to be solved)	Traditional small-scale booksellers lack digital channels, limiting their customer reach. Meanwhile, readers encounter complex multi-step checkout processes on major bookstore platforms, resulting in high rates of cart abandonment.
2.	Idea / Solution description	BookVerse is a MERN stack web app separating Customers, Sellers, and Admins. Customers browse books and buy via a single checkout. Sellers manage listings and ship orders. Admins verify registrations.
3.	Novelty / Uniqueness	Features a "Buy Now" direct-checkout button that skips complex multi-step cart configurations. It has a zero-cost dedicated seller portal with cover image uploads and custom SVG analytics dashboards.
4.	Social Impact / Customer Satisfaction	Supports small booksellers by enabling digitizing operations with zero technology overhead. Customers benefit from a fast, beige-accented, clean shopping UI designed to decrease cart abandonment and improve ordering ease.
5.	Business Model (Revenue Model)	Sellers list books for free, and the platform can charge a micro-transaction fee (e.g. 2-5%) per successful checkout, or offer premium visibility placement for books.
6.	Scalability of the Solution	Engineered under MVC architecture. Node/Express backend APIs can scale horizontally, and MongoDB Atlas manages global replica sets and handles high concurrent read/write scaling.
